

CAAD 4 ROAD BIKE ASSEMBLY SUPPLEMENT

The CAAD 4 road bike frame uses cable housing stops on the downtube for the routing of the shift cables. In order to most easily adjust the shift cable tension, use the included adjusting barrels in the cable stops before routing the cables through to the derailleurs.

See the following illustration regarding the proper installation of each adjusting barrel (part# 106373 or Quality Bicycle Products # BR4040) into the existing cable stops on the bike's downtube. Position the two small wings on the barrel against the frame to keep it from rotating in the cable stop.

NOTE: The use of these adjusting barrels is optional. They simply aid in the adjusting of derailleur cable tension.
